

Technical Postmortem

1. Project Objectives

Entropy Loop is a tactical game combining autochess and deck-building, developed in Unity using C#. Players build and evolve multiple card decks that allow them to summon and position units on a board, where battles unfold automatically. Strategy is driven by unit placement, card synergies, and progression across successive runs.

2. What Worked Especially Well

A. Bug Fixes

- Thanks to our beta testers, identifying bugs was easy, players frequently provided feedback with screenshots to show us the issues.
- Our bug tracking system has allowed us not only to gather player feedback but also to quickly identify the source of bugs and then resolve them promptly.

B. Performance and Stability

- With our procedural map generation, maintaining a steady 60 FPS while keeping CPU, GPU, and RAM usage in check was a major challenge but it went off without a hitch.

3. Difficulty Encountered

A. Our First Game

- This is our first game developed using Unity, and we're still learning every day about the best practices for creating a stable, functional game with reusable code.

B. Moving Entities

- The system for moving entities has been modified numerous times based on our various experiences and artistic decisions.

4. Future Improvements

- We're going to update the graphics and sound effects to make the game look better and be more enjoyable to play.

- We will also incorporate the many suggestions made by players during the various playtests we conducted.
